Congratulations on your purchase of a fine quality thread stand. Every sewer knows the importance of a smooth, even, low friction feed for thread. The spool pin placement on a standard sewing machine is not ideal for many types of threads and makes thread delivery difficult causing frustration. This stand allows the sewer to use many different threads (on spools or economical cones) in several different delivery methods, allowing smooth, low friction, and free flowing thread.

- Sturdy, weighing in at approximately 4½ lbs., will not slide, tip over, shake and vibrate like lighter weight thread stands.
- Quality steel piece completely CNC machined, tig welded, hand polished, and assembled in the USA.
- This stand has a beautiful gunmetal black finish that any sewer will love to use and look at.
- Does not take up a lot of space, base is slightly less than 4 ½” in diameter, and easily sits next to your sewing machine.
- Polished smooth large radius thread guide eye allows for very low friction while keeping the thread in place, easy and fast to thread with a slide in opening.
- ¼” diameter thread pole with adjustable height (approx. 10-1/2” to 16”) allows the sewer to choose a horizontal feed over to the machine or from a height above the machine depending on the application you desire.
- Thread guide eye swivels 360 degrees to allow the thread to guide off the spool where you set it.
- Easy to use thumbscrew locks the adjustable height thread pole in place until you decide to change it.
- Will last a lifetime, (actually for generations!) with proper care and handling. DO NOT OVERTIGHTEN THUMBSCREW, finger tight will work just fine.

Comes with 1 cone adapter, 2 medium spool pin locks (for horizontal spools), 1 small pin lock (for use with vertical feed spool application).

Applications:

Horizontal spool

For all of your regular sewing needs with spools of thread. Allow spool to move freely, do not snug medium pin lock to spool. For bobbin winding, (to prevent backlash) you can put the slightest pressure on the spool with the spool pin lock.

Vertical cone

Cone thread is much more economical to use but can't be used with the spool pins on standard machines. Cones can be used with or without the cone adapter. Cones are usually smooth and do not need spool caps.

Vertical spool

Used for very fast sewing or bobbin winding. Keeps spool unmovable to allow thread to wind off spool instead of turning the spool to unwind thread. Prevents backlash of thread. Just use the small or large spool caps that came with your sewing machine or serger. Can be used with or without small spool pin lock, or you can order the optional vertical feed spool cap (one size fits all).

This picture shows use with your sewing machine's spool cap and a spool pin lock. The spool cap is not included with the thread stand. You can also use this set up on the horizontal spool pin to run thread over to a portable bobbin winder.

Dual and Triple thread feed

Home sewing threads often look too thin for hems in jeans or for topstitching. This delivery allows you to double your thread for a thicker thread look. Thread the two threads together as one through the machine and a larger eye needle (needle not included). Most machines will sew this way, there may be a few that won't. Can also be used for twin and triple (with vertical feed added) needle stitching if using the same size and type of thread (if your machine will accommodate specialty needles).

Optional accessories:

Dual Adjustable Thread Poles

1/8" diameter Dual Adjustable thread poles for 2 thread separation. Each adjusts from approx. 10-1/2" to 16". These are used whenever the sewer wants to keep the 2 threads separate that feed over to the sewing machine, like when using specialty threads, metallic threads that tend to cling to each other, or for some twin needle applications. Just remove the 1/4" thread guide pole and insert the two 1/8" poles, adjust separate feed heights and swivel thread guides over spools then lock into place with thumb screw.

Vertical Spool Cap All steel, smooth polished, black gunmetal finish. Spool centering taper on one side for smaller spools and flat on other side for standard 1.5" spools. Use when edges of spools are not smooth. Fits over 3/16" spool pin. Align thread guide eye over spool pin. Heavy enough to hold spool down. Just use either side for whatever application you require.

Complete Thread Stand Set with optional accessories included

Includes Thread Stand with 1/4" adjustable thread guide pole, vertical feed spool cap, 1/8" dual adjustable thread guide poles, spool pin locks 2 medium and 1 small, and cone thread adapter.

All included accessories: ordered separately
Spool pin locks (medium and small)
Plastic Cone adapters
